

Beginner Guide — Vercel CLI One-Click Kit

New to computers or the command line? That's fine. Follow the steps in order. The only thing to remember: **double-click** 시작하기.bat .

For full details / command table / license, see [README.en.md](#). 한국어 Korean step-by-step: [왕초보가이드.md](#)

Step 0. What this kit does

It lets you use **Vercel** (which puts your website on the internet) through a simple **Korean menu** instead of a black command window. **No admin (UAC) popup appears.**

You need beforehand: Windows 10/11 · internet. (Node.js is installed automatically if missing.)

Step 1. Start

1. Double-click 시작하기.bat in this folder.
2. If a blue SmartScreen warning appears → **More info** → **Run anyway** (normal for new files).
3. The Korean guide window opens.

Use ↑ ↓ + **Enter**, or press a **number key**. Read only the top line ">> 지금 할 일" — it shows the next number to press.

Step 2. Install (once)

1. Choose **[1] Install**.
2. If **Node.js** is missing:
 - Press **Y** to auto-install — a **portable Node.js with NO admin popup** (recommended), or
 - Get the **green LTS button** at nodejs.org, install it, then **close the window and run** 시작하기.bat **again** (a new window is required).
3. If Node.js is present, a black install window runs and **finishes automatically** (3–10 min — don't close it).
 - **If already installed**, it just finishes (updating is separate — see Steps 4 & 5).

💡 **No admin (UAC) popup appears** — both the kit and the auto Node install (portable) go into your user

folder only.

Step 3. Login (once)

1. **[2] Use → [1] Login.**
2. Your browser opens — sign in / authorize there.
3. It returns to the window automatically; a Korean "success + next step" note appears.

No account? Create one free in the browser (GitHub/email). If login shows "not confirmed" → **[6] Diagnose** → **[4] Verify login.**

Step 4. Deploy to the internet

1. You need a **folder that contains your website files** (e.g. an `index.html`).
2. **[2] Use → [4] Deploy.**
3. A **"Is this the right folder?"** check appears → `Y` if correct, or `N` then paste another path.
4. Pick one:
 -  **Preview (recommended)** — temporary URL, live site untouched.
 -  **Production** — visitors see it; requires typing `YES` (case-insensitive).
5. A **URL** appears — that's your site!

First deploy asks a few questions in English. **Pressing Enter (defaults) is usually fine:**

Question	Answer
Set up and deploy?	Y + Enter
Which scope?	just Enter
Link to existing project?	N + Enter (first time)
Project name?	just Enter
In which directory?	just Enter

When it finishes, a **Korean "success + next step"** note appears right below. 🔗 Domains, env vars, logs, rollback (Advanced) live in **[2] Use → [5] Advanced.**

Step 5. Update (occasional)

To get the latest Vercel (no admin popup):

- **RUN.bat** → 11 Update (or [10] Tools → 2)
- or 시작하기.bat → [2] Use → [5] Advanced → U

Usually optional — only when errors keep happening or you need new features.

Step 6. Remove (uninstall)

1. [3] **Remove** (or UNINSTALL.bat).
2. Confirm by typing **YES** (case-insensitive).
3. **Your own code/files are kept** — only the Vercel tool is removed.

Troubleshooting

💡 **Fastest path:** On the start screen, press [6] **Diagnose / Fix**. It shows your current status (install/login/internet) and pinpoints what to do next.

Problem	Fix
"Node.js not installed"	[1] Install → auto (Y), or get LTS from nodejs.org
Blue SmartScreen warning	More info → Run anyway
Install keeps failing	Pause antivirus (below), retry / check Wi-Fi
vercel not found	Close window, run 시작하기.bat again
Scary English error	A Korean explanation + next step now appears right below it
Login shows "not confirmed"	[6] → [4] Verify login
Arrows don't work	Just use number key + Enter
The black window looks scary	It just means work is in progress — don't close it

🔧 **If antivirus blocks the install:** Start → **Windows Security** → **Virus & threat protection** → **Manage settings** → turn **Real-time protection** off briefly → retry [1] Install → **turn it back on** when done.

Where are the files?

- **Always start with** 시작하기.bat (this folder).
 - Docs: README.md (KO) · README.en.md (EN) · 왕초보가이드.md (KO) · GUIDE.en.md (EN) + PDFs.
 - Vercel installs to %APPDATA%\npm ; portable Node to %LOCALAPPDATA%\Programs\node-portable .
-

One-page summary

Double-click 시작하기.bat

- [1] Install (once)
- [2] Use → Login (once)
- [2] Use → Deploy → Preview (safe)
- (when confirmed) Production = type YES
- stuck? → [6] Diagnose / Fix

Stuck? Read only the top line ">> 지금 할 일" — it always shows the next number to press.
