

Vercel CLI One-Click Kit

A **Korean-first helper** that lets total beginners install Vercel and publish a website with **one double-click** — no scary command line required.

- **Vercel**: a service that hosts (deploys) your website/app on the internet for free.
- **This kit**: lets you do that through a friendly **Korean menu** instead of a black command window.
- Installs with **no admin (UAC) popup** — the Node.js auto-install is admin-free too.

kr Korean: [README.md](#) · Step-by-step: [GUIDE.en.md](#)

⚡ Quick start (3 steps)

Step	Do this
1	Double-click 시작하기 .bat ("Start Here") in this folder
2	Press the number shown next to ">> 지금 할 일" ("Do this now") — usually [1] Install → [2] Use → Login → Deploy
3	Done. The screen always tells you the next number to press

Use ↑ / ↓ + Enter, or just press a number key.

📋 Prerequisites / required programs

Item	Required?	Notes
Windows 10 / 11	Required	Windows only.
Internet	Required	For install, login, deploy.
Node.js 18+	Auto	If missing, the kit installs a portable (admin-free) copy (or guides you to nodejs.org).
Vercel CLI	Auto	[1] Install sets it up automatically.

Item	Required?	Notes
Web browser	For login	Vercel login happens in your browser.
Vercel account	For login	Create one free in the browser (GitHub/email).
Admin rights	❌ Not needed	No UAC popup.

Download / install

1. **Get the kit:** if you received a zip, **extract it** into one folder.
2. **Unblock:** Windows may block files from the internet → 시작하기.bat **auto-unblocks** them. (If not: right-click file → Properties → check **Unblock** → OK)
3. **Install:** double-click 시작하기.bat → **[1] Install** .
 - If Node.js is missing → **Y (portable, admin-free)** or the nodejs.org guide. Then **close the window and run it again**.
 - A black English install window is normal. **Don't close it** (3–10 min).

💡 Blue SmartScreen warning → **More info** → **Run anyway** (normal for new files).

How to run / first screen

Opening 시작하기.bat shows your computer status at the top:

```
[Your computer status]
- Node.js (required)   : OK / missing
- Vercel CLI           : OK / needs install
- Vercel login         : OK / login needed

>> Do this now: press [1] Install.
```

- Green [OK] = ready / Yellow [needed] = press the number the screen suggests.

Workflow (full flow)

```
시작하기.bat
→ [1] Install           (once: Node.js + Vercel CLI)
→ [2] Use → Login       (once: log in via browser)
```

- [2] Use → (Link) (optional: link this folder to Vercel)
- [2] Use → Deploy → Preview (safe, temporary URL)
- when confirmed → Production (type YES)

Stuck? Use [6] Diagnose / Fix anytime.

📁 How to use — Start menu (Korean UI)

#	Name	What it does
1	Install	Installs Vercel CLI (auto-guides Node.js). If already installed, it just finishes.
2	Use	Login · Link · Deploy · Advanced (domains/env/logs/promote)
3	Remove	Cleanly uninstalls (your own code/files are kept)
4	Guide	Opens the beginner guide
5	Dashboard	Opens the Vercel web dashboard
6	Diagnose / Fix	Re-check status + fix errors + verify login
0	Exit	Closes the window

🧰 Full features — RUN.bat menu

RUN.bat gathers every feature in one place. Simple front, full detail inside:

- **Most used:** 1 Preview deploy · 2 Production deploy · 3 Login · 4 Who am I
- **By group:** 5 Account/Team · 6 Project/Deploys · 7 Env vars · 8 Domains · 9 Advanced · 10 Tools
- 11 Update (latest Vercel) · 0 Exit

📋 Command table (menu ↔ real Vercel command)

Pressing a menu item runs the real command for you (no typing needed).

Action	Real command
Preview deploy	vercel
Production deploy	vercel --prod

Action	Real command
Run locally	<code>vercel dev</code>
Redeploy	<code>vercel redeploy</code>
Login / Logout	<code>vercel login</code> / <code>vercel logout</code>
Who am I	<code>vercel whoami</code>
Teams / Switch	<code>vercel teams ls</code> / <code>vercel switch</code>
Link folder	<code>vercel link</code>
List / Inspect / Logs	<code>vercel ls</code> / <code>vercel inspect <URL></code> / <code>vercel logs <URL></code>
Open in browser	<code>vercel open</code>
Env list/add/remove/pull	<code>vercel env ls</code> / <code>add</code> / <code>rm</code> / <code>pull</code>
Domains list/add/remove	<code>vercel domains ls</code> / <code>add <domain></code> / <code>rm <domain></code>
DNS / Alias	<code>vercel dns ls <domain></code> / <code>vercel alias <URL> <domain></code>
Promote / Rollback	<code>vercel promote <URL></code> / <code>vercel rollback <URL></code>
Remove deploy / Pull settings	<code>vercel remove <URL></code> / <code>vercel pull</code>
Init / Help / Version	<code>vercel init</code> / <code>vercel help</code> / <code>vercel --version</code>
Update	<code>npm install -g vercel@latest</code>

Preview vs Production (important)

Type	Meaning	Safety
Preview	Temporary URL, only you check it	 Safe (recommended) — live site untouched
Production	Visitors see it immediately	 Caution — requires typing <code>YES</code> (case-insensitive)

Nothing goes live until you type `YES`.

Update (once in a while)

To get the latest Vercel (no admin popup):

- **RUN.bat** → 11 Update (or [10] Tools → 2)
- or **시작하기.bat** → [2] Use → [5] Advanced → U

Usually optional — only when errors keep happening or you need new features.

How to remove

- **시작하기.bat** → [3] **Remove** (or double-click **UNINSTALL.bat**)
- Requires typing **YES** (case-insensitive). **Your own code/files are kept.**
- Removes: Vercel CLI (global npm package) + config folder (`%USERPROFILE%\vercel`).

File / document locations

```
Vercel-CLI_One-Click_Kit/
├─ 시작하기.bat          ← start here (Korean UI)
├─ lib/start.ps1         ← Korean screen (internal, auto-run)
├─ INSTALL.bat           ← install engine (bilingual)
├─ RUN.bat               ← full menu (grouped, all features)
├─ UNINSTALL.bat         ← uninstall engine (bilingual)
├─ README.md / README.en.md
├─ 왕초보가이드.md / GUIDE.en.md
├─ README.pdf / README.en.pdf / 왕초보가이드.pdf / GUIDE.en.pdf
├─ LICENSE / NOTICE
└─ .gitattributes / .gitignore
```

Install locations (for reference):

- Vercel CLI → `%APPDATA%\npm` (user folder, no admin)
- Auto Node.js (portable) → `%LOCALAPPDATA%\Programs\node-portable`
- Login token → `%APPDATA%\com.vercel.cli\Data\auth.json`

Troubleshooting

Symptom	Fix
"Node.js not installed"	[1] Install → auto (Y) , or get LTS from nodejs.org
Blue SmartScreen warning	More info → Run anyway

Symptom	Fix
Files seem blocked	<code>시작하기.bat</code> auto-unblocks; else right-click → Properties → Unblock
Install keeps failing	Pause antivirus (below), retry / check Wi-Fi
<code>vercel</code> not found	Close the window and run <code>시작하기.bat</code> again
Scary English error	A Korean explanation + next step now appears right below it — just follow it
Login shows "not confirmed"	<code>[6]</code> → <code>[4]</code> Verify login for the real status
Arrows don't work	Use number key + Enter
The black window looks scary	It just means work is in progress — don't close it

🔧 If antivirus blocks the install (pause briefly):

1. Start → **Windows Security**
2. **Virus & threat protection** → **Manage settings**
3. Turn **Real-time protection** off briefly → retry `[1]` `Install`
4. **Turn it back on** when done (important!)

🔒 Safety / privacy

- Runs **without admin rights**; does not touch system folders.
- The login token is stored by Vercel's official CLI in **your user folder** (the kit does not collect or transmit it).
- The kit **sends no data anywhere** of its own (Vercel commands talk only to Vercel servers).
- Irreversible actions (production deploy, uninstall) require a **YES** confirmation.

📄 License / copyright / commercial use (please read)

This kit
